

Transaction Dispute & Fraud-Triage Copilot

Product Walkthrough

Demonstration environment: Asteria Bank · Risk & Disputes Operations

Prepared for client review

Prepared by: [Sourish Reddy/ Kolavali Tejasri]

1. About This Project

The Transaction Dispute & Fraud-Triage Copilot is an AI-assisted case-investigation tool built for a bank's Risk & Disputes team. When a customer says “I don't recognize this charge,” an analyst today has to manually pull the transaction, check the customer's history, look up the right chargeback policy, and judge the fraud risk — a process that can take several minutes per case and vary from one analyst to the next.

This Copilot automates that investigation end-to-end. The analyst simply records what the customer said; the system then verifies the transaction, screens for fraud risk, retrieves the exact bank policy that applies, and returns a recommended action — in seconds, with a full, auditable trail behind every step.

It was built as a working prototype to demonstrate how AI can be safely used in a regulated, financial workflow: the language model is only used to understand the customer's statement, never to make the financial decision itself. Every recommendation is produced by deterministic, rule-based logic that can be checked, audited, and explained — which is essential for banking compliance.

The pages that follow walk through the same screens an analyst would use: first the customer's account information (the inputs), then a live example of a dispute being filed and resolved (the output).

2. Exploring the Workspace

Before filing a dispute, the customer has a 360° view of their account. These screens are the “input” side of the system — the information the Copilot already has access to when it starts an investigation.

A closer look at the same dashboard: verified identity (KYC), recent activity, and spending by category, all in one place before any case is opened.

Back on the Transactions page, the analyst identifies the charge in question — a ₹1,299 purchase at Metro Grocers — and selects “Dispute” to begin.

3. Filing a Dispute Claim

This is where the analyst hands the case to the Copilot. The only input required is the customer's own statement — in their own words — and, if known, which transaction it relates to.

Investigation result Waiting

Run a dispute to see the recommendation, fraud indicators, policy evidence and customer-safe outcome.

Dispute Investigation Journey Actual graph path for this case

Run a dispute to see how the case moves through the investigation workflow.

Human review **Customer-safe response**

The Dispute Copilot screen: a simple intake form where the analyst (copilot) records exactly what the customer said, alongside the transaction being questioned.

If a claim is submitted without a clear transaction reference, the Copilot recognizes the gap and asks the analyst to confirm which transaction is being disputed — rather than guessing.

4. The Investigation Output

Once the claim is complete, the Copilot runs the full investigation automatically — fraud scoring, policy lookup, and a final recommendation — and shows its work at every step.

Run RUN-f4fb119c2faf

Executed path:

Case Authorization → Secure Intake & Context → Workflow Routing → Dispute Classification → Evidence Collection → Fraud Assessment → Policy Verification → Decision Engine → Finalization & Audit

✓ Case Authorization

Checks whether the current analyst is authorized to work on the case.

Input: Case ID + analyst authorization context

Output: Case authorization accepted

EXECUTED

4 ms

✓ Secure Intake & Context

Protects the submitted message and prepares trusted case context.

Input: Customer dispute statement + claim fields

Output: Input isolated; context prepared; memory recalled

EXECUTED

10 ms

✓ Workflow Routing

Determines which investigation stage should run next.

Input: Current case state + completed investigation stages

Output: Next stage: finalize

EXECUTED

0 ms

6 executions

✓ Dispute Classification

Identifies the type of dispute from the customer's statement.

Input: Masked customer statement + prior conversation context

Output: Intent: unauthorized; confidence: 0.95

EXECUTED

3672 ms

✓ Evidence Collection

Retrieves the disputed transaction and supporting customer evidence.

Input: Transaction selection + dispute context

Output: Transaction evidence retrieved, history records: 3; source: case_or_user_selection

EXECUTED

3861 ms

✓ Fraud Assessment

Calculates transaction and claim-abuse risk indicators.

Input: Transaction + recent activity + customer/account signals

Output: Fraud risk: low; score: 0.01; claim abuse: 0.20

EXECUTED

4 ms

✓ Policy Verification

Retrieves and verifies the policy that applies to the dispute.

Input: Dispute intent + masked dispute context

EXECUTED

732 ms

Every recommendation is fully traceable. The Investigation Journey shows each stage the case passed through — authorization, secure intake, classification, evidence collection, and more — so nothing is a “black box.”

The trail concludes with fraud scoring, policy verification, and a final decision — plus a ready-to-send, customer-safe response, giving the bank a complete audit record for every case.
